

Together We Can

- * Provide technology for Clinical Integration
- * Maximize P4P opportunities
- * Increase per patient revenue
- * Improve quality healthcare
- * Provide decision support at the point-of-care
- * Easily measure & report

“Working with a clinically savvy and care-focused technology vendor has simplified my integration tasks and accelerated our deployment activities. We are very happy we chose DocSite as a clinical integration technology partner.”

- Victoria Viglucci, CIO

Connected Health Communities have arrived!

Healthcare organizations continue to invest millions of dollars in Health IT with the goal of enhancing patient care while reducing costs. IPAs, PHOs and hospital systems particularly feel the need to integrate their systems and providers into a cohesive unified care process sharing appropriate clinical information relevant to each patient being cared for.

With growing demands for analysis and reporting from public and private payers, as well as pressure from the federal government to clinically integrate or face obsolescence, how do physicians and CIOs combine these investments in systems to create a unified picture of the care process? DocSite can help.

Facilitating the clinical integration movement

DocSite Connect[™] makes establishing rigorous standards for quality and efficiency simple. Unlike traditional electronic data interface systems, DocSite Connect incorporates clinical guidelines and measures into the data exchange process.

Data can originate from electronic IT systems or paper-based offices offering many inputs and one coordinated view of the organization. Further, the warehouse matches and cleanses clinical data gathered from physician offices for reporting and benchmarking purposes across the organization.

Building the warehouse – Core Technology

DocSite Connect is an integrated data warehouse built on a Microsoft[®] SQL Server platform. The warehouse provides an honest broker of information amongst different systems in a HIPAA compliant manner. It can import and export patient demographics, lab results (LOINC) and other data using HL7 and related NCVHS sanctioned standards.

The warehouse also imports and exports to XML, CSV and Excel formats for use with statistical analysis applications. The warehouse incorporates a sophisticated configurable rules engine and patient matching system on both imports and interfaces.

Benefits to You

- * Guideline-driven decision support at the point-of-care
- * Connect with clinical Health IT systems already in place
- * Easily establish, monitor and report utilization and quality performance
- * No programming required to modify measures
- * Easy to access and publish benchmarking data
- * Detailed reporting capabilities across the organization

Key Features

- * HIPAA compliant database
- * Standards-driven interoperability
- * Over 5000 measures covering 300 conditions included
- * Rules-driven data filtering
- * Complex data analysis capability
